Vivid Edge Integration COE — Timesheets, Approvals & Reporting

Generated October 23, 2026

TimeSync is Vivid Edge Integration COE's timesheet, approval, and reporting application. This guide walks through everything you can do in it, organized by what you're trying to accomplish. If you only do one thing with this document, read Section 1 — it covers the weekly habit every employee needs, and it's designed to take you well under a minute once you know it.

Your available menu items and screens depend on your role — see Section 9 for a summary of who can do what.

Finding your way around: the left sidebar lists Dashboard, Timesheets, Approvals, Reports, Projects, Users, and Holiday Calendars, in that order — the items you'll use most often are near the top. Super Admins additionally get a Settings link pinned at the very bottom of the sidebar, below a divider. Two things live in the top bar instead of the sidebar: your notifications (the bell icon, top right) and logging out (click your name/avatar, top right, for Logout).

1. Logging your time (every employee)

1.1 Four views, one set of data

Click Timesheets in the left sidebar. A tab strip at the top lets you switch between four views of the same underlying data — entering an hour in one view shows up in all the others immediately:

- Monthly (the default view when you open Timesheets) — every week that falls in the selected calendar month, stacked as a series of weekly grids, with one shared comments box and one Submit button for the whole month.
- Fortnight — the same idea over two consecutive weeks.
- Weekly — one week's grid, the most detailed view, with its own Submit.
- Daily — one day at a time as a simple list (handy on mobile).

Each week within the Monthly/Fortnight views is still its own week for approval purposes — submitting a month submits every week in it together, but each week is reviewed and approved on its own.

Compact view: Monthly and Fortnight views hide Saturday/Sunday columns by default to save space. Click Compact view in the toolbar to toggle weekends back on — the setting is remembered on your device for next time. Hiding weekend columns only affects what's shown; hours already logged on a weekend still count toward your totals and warnings either way.

1.2 The grid

You'll see one row per project or task you're assigned to, and one column per day, with a running total column on the right and a total row at the bottom.

- Enter hours: click a cell and type a number. Use the arrow keys or Enter to move between cells without touching the mouse.
- Add a project row: use the search box above the grid to find and add a project/task you're assigned to but that isn't showing yet. This list only ever shows projects you're actually a member of — regardless of role, logging time against a project always requires being assigned to it.
- Logging PTO, jury duty, an internal meeting, or general admin time: every employee is automatically a member of a standing Time Off & Admin project (search for it like any other project) with tasks for exactly this — PTO, Jury Duty, Meeting, and Admin. It never expires and isn't billable, so it's always available without needing to ask a Project Admin to add you to anything.
- Comments: a small comment icon sits next to every hours box. Click it to open a small overlay window and type what that entry was for — the comment stays with that specific entry (nothing is shown inline in the grid until you open it, keeping the grid uncluttered). A comment becomes required on any entry over 8 hours; the icon turns red until you add one.
- Comments for this period: Monthly, Fortnight, and Weekly views each also have one comments box at the bottom for overall context on the whole period — this is where the "at least one comment somewhere" rule (below) is easiest to satisfy in one shot.
- Autosave: everything you type saves as a draft automatically within a couple of seconds — watch for the small save indicator. You can close the tab mid-entry and pick up exactly where you left off later.
- Copy feature: every view has a Copy button ("Copy Last Week", "Copy previous fortnight", "Copy previous month", "Copy from previous day") that pre-fills the current period from the immediately preceding period of the same length — hours and the project/task list carry over, but comments are

always left blank so you're not accidentally forwarding an old note.

- Download: Monthly and Fortnight views have a Download button that exports the whole grid exactly as shown — one row per project/task, one column per date across every week in the period — as an Excel file.

1.3 Mandatory conditions

The system enforces a few rules on top of your own project's hour caps:

Condition	What happens
Under or over the standard 40h week	Nothing — this is fine on its own, no warning.
A week totals over 50 hours	A warning at submit time asking you to double-check — you can still submit.
A week totals over 70 hours	Blocked. You cannot submit until you fix the entries.
Time logged on a date in one of your holiday calendars	A warning at submit time asking you to confirm the entry is legitimate — you can still submit.
No comment anywhere in the submission	Blocked. At least one comment — on any single entry, or in the period's comments box — is required before you can submit; even one comment for one day is enough.

These checks run per calendar week (Mon–Sun) regardless of which view you used to enter the time, and the same rules apply whether you're submitting one week or a whole Monthly/Fortnight batch at once. Which holidays you're warned about depends on your own project assignments — see "Your holiday calendars" at the end of Section 1.4.

1.4 What the colors mean

The grid checks your entries as you type, before you ever hit submit:

What you see	What it means
Red cell + message	Blocking. You're not assigned to that project, it's outside the project's active dates, or you've gone over a configured hour cap. Fix it before you can save that entry.
Amber highlight	Warning. Unusually high total for one day across all your projects (e.g. over 12 hours) — you can proceed, but confirm it's intentional.
Dark day column with small colored dots	Holiday. One dot per calendar with a holiday on that date — see "Your holiday calendars" below. Hover the day header for the holiday name(s) and which calendar each belongs to. Informational only — you can still log time that day, and it's still the same "confirm it's legitimate" warning at submit time described above.
A cell that won't save	Usually a missing required note on a large entry — add the note and it will save.

Your holiday calendars. TimeSync doesn't use one single company-wide holiday list — each client can have its own holiday calendar, color-coded (set up by HR/Super Admin in Holiday Calendars, Section 5). You only ever see the calendars for clients you actually have a project under — nothing else. In practice, every employee is on the standing Time Off & Admin project (an internal "client"), so everyone sees at least that calendar's holidays by default; any other client you log time against adds its own calendar's holidays on top. If two of your calendars both have a holiday on the same date (e.g. your internal calendar and a client's both mark Thanksgiving), that day shows both colored dots — hovering the header lists every holiday and which calendar it's from. A client with no calendar assigned contributes no holidays at all.

1.5 Submitting

When your period looks right, click Submit. You'll see a summary of total hours, any warnings (over 50h, a holiday entry), and — if something is blocking (over 70h, or no comment anywhere) — exactly what to fix, before you can confirm. Once submitted, your status moves to Submitted and it heads to your approver (see Section 2).

- Changed your mind? As long as your approver hasn't acted on it yet, click Recall (from Weekly view) to pull that week back to Draft and keep editing.
- Once approved, a week's entries lock — you can no longer edit them yourself. If something needs to change, ask your approver to reject it (with a comment explaining why), which reopens it for editing.

1.6 Your dashboard

The Dashboard (your home screen) shows this week's status at a glance: total hours logged, hours remaining against a standard week, your top projects by hours, and any org announcements (e.g. an upcoming holiday and its effect on the submission deadline). It also shows a calendar view of your last several weeks so you can spot a missing or rejected week quickly.

2. Approving timesheets (Project Admins & Super Admin)

Every submitted timesheet goes through exactly one approval: the Project Admin of the project it logs the most time against. There is no second/final tier — HR Admin does not approve timesheets. Super Admin can always act as a fallback approver on any timesheet.

- Self-approval: if a Project Admin is the only person logging time against their own project (i.e. they're one of the resolved approvers for their own submission), their timesheet is approved automatically the moment they submit it — there's no one else who could meaningfully review it.

2.1 The Approvals inbox

Click Approvals. You'll see every timesheet currently waiting on you, with the employee, the week, total hours, when it was submitted, and how many days it's been pending. Filter by department or how long something has been waiting.

- View details: click the eye icon on any row (any tab) to see that timesheet's actual day-by-day entries, notes, and approval history before deciding — no need to approve or reject blind.
- Approve: click the checkmark. Optionally leave a comment. This is final — the employee gets an immediate confirmation and the data is now considered settled for reporting purposes.
- Reject: click the X. A comment is required — the submitting employee sees it immediately along with which entries were flagged, and their timesheet reopens for edits.
- Bulk approve / bulk reject: for straightforward weeks that don't need line-by-line review, select multiple rows and act on them together.
- Delegate: heading out on leave? Click Delegate my approvals (top right of the Approvals screen) to nominate a proxy — anyone who's a Super Admin, or who already administers at least one project — for a date range. While it's active, every timesheet you'd normally approve also appears in the proxy's own Pending tab automatically; they don't need to do anything else to see or act on it, and you can still act on it yourself too if you're reachable after all. Revoke it early from the same panel, which keeps a record of past delegations rather than deleting them outright.

2.2 Looking up someone's timesheet

Need to check what a specific person submitted — including an older, already-approved period, not just what's currently waiting on you? Click the All Timesheets tab (next to Pending/Approved/Returned). Search for one or more people, optionally narrow by status or a date range, and click the eye icon on any row to see its full day-by-day breakdown (hours, notes, and its approval history) without having to approve or reject anything. A Project Admin sees this for anyone who shares a project they administer; Super Admin and HR Admin see everyone.

2.3 SLA and escalation

Every pending item shows how many days it's been sitting in a queue. If a timesheet has no resolvable Project Admin, or sits too long (the org's configured threshold), the system automatically notifies every Super Admin so a stalled approval doesn't depend on someone remembering to chase it.

3. Managing projects & clients (Project Admins & Super Admin)

Click Projects. This screen has two tabs: Projects and Clients.

- Clients tab: every project belongs to a client. Click New Client to add one (name and an Active/Inactive status) before it can be selected when creating a project. This tab also shows, for each client, how many projects are currently linked to it, and its assigned Holiday Calendar (if any) — HR Admin and Super Admin get a dropdown right in this column to assign or change it (Project Admin sees the assignment but can't change it). See Section 5 for how holiday calendars work and why a client might deliberately have none.
- New Project (Projects tab): pick a client from the list you built on the Clients tab, give the project a code and name, set its dates, its billing type (T&M / Fixed / Managed Services — the contract type), and search-and-select one or more project admins (type a name to search any user; pick as many as you need). You can also add the project's tasks right here — each task gets its own name, estimated hours, and a Billable/Non-billable flag.
- Budget hours are never entered directly — a project's budget is the sum of its tasks' estimated hours, rolled up automatically. Add or adjust tasks (in the New Project form or later, from the Tasks tab) to change it.
- Edit vs. Members icon: a project row's Edit icon opens the full modal (Overview/Tasks/Members, starting on Overview); its Members icon opens a focused dialog showing only the member list — a quick way to add/remove people or adjust hour caps without the rest of the project's settings in view.
- Sub-tasks live inside their project, not as their own menu: open a project (the eye/pencil icon) and use its Tasks tab to add sub-tasks (e.g. "Requirements", "Build", "Testing") — each can have its own active date window, estimated hours, Billable/Non-billable flag, and be closed independently of the parent project. There's no separate top-level "Tasks" screen — a sub-task only ever makes sense in the context of the one project it belongs to, so it's managed there.
- A project can have more than one admin: from a project's Members tab, the "Project admins" section lists everyone administering it, lets you search-and-add another, and remove one (a project must always keep at least one). Any of a project's admins can approve its timesheets.
- Only a project's own Project Admin (or Super Admin) can add people to that project or its tasks — this applies to both the "Project admins" and "Members" sections. Anyone else can still view the Members tab, but won't see the add/remove controls.
- The same restriction applies to the Overview tab: only that project's own admin (or Super Admin) can change its Name, Start/End date, Status, Billing type, or the "Send timesheets to the client" setting. Anyone else with view access to the project (e.g. an assigned team member) sees a plain read-only summary of these instead of editable controls, so it's clear at a glance who owns that project's settings.
- Team members: from a project's Members tab, assign the people who can log time against it. You can also set an individual's maximum hours per day/week on this project here (e.g. capping a part-time engagement at 20h/week) — this cap is what powers the red-cell blocking rule employees see in their grid.
- A project admin is automatically also a team member on that project — they appear in both the "Project admins" and "Members" sections (labeled "Project Admin" in the latter), and can log their own time against it like anyone else. The same person can likewise be an admin on one project and a plain member on a different one; either way, every project they're on shows up in their timesheet's project picker.

- Sending timesheets to the client: from a project's Overview tab, check "Send timesheets to the client for this project" and enter the client's contact email. This unlocks a Send timesheet to client… link that opens a review page: pick the period, see every logged entry across all users for that project (all selected by default, with the option to deselect a few), then send. The recipient email is asked for again at send time (pre-filled from the project setting, but editable), and everything selected is sent as a single file. There's no live email provider wired up in this build — sending is logged as a real, downloadable audit record (who sent what, to whom, and the exact file) rather than an actual inbox delivery; see the README's "Swap points" for wiring in a real provider.
- Archived / out-of-window projects become read-only for new time entry but stay fully visible in historical reports. A project's status is one of Active, On-Hold, Archived, or Completed.
- Deleting a project (Super Admin only) permanently removes it along with its sub-tasks, team assignments, and — importantly — any time entries and approval history logged against it. There's no undo. For a project that has real logged time, prefer changing its status to Archived instead of deleting it, so the historical data stays available in reports.

4. Managing users (HR Admin & Super Admin)

Click Users.

- New User: set employee ID, name, work email, department, role, job title, reporting manager, and start date. Every new user (single-created here or added via Bulk Upload) is automatically enrolled in the standing Time Off & Admin project (see Section 1.2) so they can log PTO/admin time from day one without any extra setup.
- Deactivate / reactivate: deactivating blocks new time entry but keeps the person's history and audit trail intact — nothing is deleted.
- Roles: see the Roles tab for the four available roles and what each can do (also summarized in Section 9 below).
- Impersonate (Super Admin only): click Impersonate next to any other active user to sign in as them — useful for reproducing what an employee sees without needing their password. A persistent amber banner stays on screen the whole time naming who you're impersonating and who started it; click Return to my account in that banner to end it. Every action taken while impersonating is attributed to the impersonated user in the audit trail, with the Super Admin recorded as the actor behind it.

5. Holiday Calendars (HR Admin & Super Admin)

Click Holiday Calendars. Instead of one single company-wide holiday list, TimeSync has any number of calendars — each with its own name and color — and each client can be assigned one of them (or none). An employee only sees the calendars for clients they actually have a project under (see "Your holiday calendars" in Section 1.4), so this is how you give different clients different holidays (a US client's federal calendar, an India-based client's calendar, a client with no holidays tracked at all) instead of every employee seeing every holiday regardless of who they work for.

5.1 Managing calendars

- Switch calendars: the dropdown at the top of the page lists every calendar — pick one to see and manage its holidays. The color dot and "Assigned to: …" line underneath show that calendar's color and which client(s) currently use it (a calendar can be assigned to more than one client, e.g. several US-based clients sharing the same federal calendar — but each client only ever has one calendar at a time).
- New calendar: give it a name and a color (pick one or type a hex code). A brand-new calendar starts with no holidays and isn't assigned to any client yet — add its holidays here, then assign it to a client from the Clients tab (Section 3).
- Edit / delete a calendar: the pencil and trash icons next to the calendar dropdown rename/recolor it, or delete it. Deleting is blocked while the calendar still has any holidays or is still assigned to a client — remove its holidays and unassign it from any clients first. This is deliberate: deleting a calendar out from under a client that's actively using it would silently drop that client's holidays with no warning.

5.2 Managing one calendar's holidays

With a calendar selected:

- Synced with the US federal calendar on request: pick a year and click Sync US federal holidays for <year> to add that year's 11 US federal holidays (New Year's Day, MLK Day, Washington's Birthday, Memorial Day, Juneteenth, Independence Day, Labor Day, Columbus Day, Veterans Day, Thanksgiving, and Christmas) into the selected calendar. A holiday that falls on a weekend is filed under its actual observed weekday, matching how the US government publishes it. Syncing is safe to repeat — it only adds what's missing from that calendar, it never duplicates or overwrites a holiday you've already customized. Sync it separately into each calendar that should carry the US federal list — it doesn't propagate to other calendars automatically.
- Add / edit / delete: use these to add a calendar-specific holiday (e.g. a client's own Founder's Day, or a regional holiday like Diwali or Heritage Day) or adjust one you've already added.

6. Bulk uploading users or projects (Excel)

Instead of entering people or projects one at a time, use Bulk Upload from the Users or Projects screen — visible to HR Admin and Super Admin only (a Project Admin manages their own projects individually, but doesn't bulk-create them). Each entry point only ever imports its own type for that whole flow — there's no switching between Users and Projects mid-wizard.

1. Download the template — an Excel file with the exact columns expected and a sample row.
2. Fill it in and upload it.
3. Map Columns: each column from your file is matched to a TimeSync field — correct automatically when your file's headers match the template, and adjustable here if they don't (or if you want to skip a column entirely). Your choice here is what actually gets imported, not just a preview.
4. Review: every row is checked *before anything is saved*. Each row is flagged Valid, Warning (e.g. a department that will be auto-created), or Error (with the specific reason — a duplicate employee ID, an invalid email, an unrecognized role, etc.).
5. Commit: you can import just the valid/warning rows and fix the error rows separately — nothing is held hostage by a few bad rows. Every import run is logged (who, when, how many succeeded/failed) for traceability.

7. Reports & analytics (Project Admin, HR Admin, Super Admin)

Click Reports. Pick a report type, a date range, and any filters (client, project, department, user, status), then Generate.

Available reports:

Report	What it shows
Timesheet Summary	Hours by user, project, client, and date, drillable down to individual entries
Project Utilization vs. Budget	Actual hours logged against a project's budgeted hours
Approval Compliance	How long approvals are taking, who decided each one, and current SLA breaches
Missing Timesheet	Who hasn't submitted for a given period, and how overdue they are
Overtime	Entries exceeding your configured daily/weekly thresholds
Audit Trail	Every create/update/approve/reject action, with who and when (Super Admin only)
Client Audit Report	Client-submittable proof of hours: every project under a chosen client, the resources who logged time on each, and their hours

The dashboard view adds a utilization donut chart and a trend line so you can see the shape of the data before drilling into the table.

Client Audit Report works a little differently: pick a Client in the filter bar (required — nothing renders until one is chosen), then Generate. The on-screen view groups by project, then by resource, with hours and entry counts per resource and a client-wide total at the top — the exact breakdown a client would want as proof of billed hours. Its CSV/Excel/PDF export goes a level deeper than the on-screen summary: one row per individual timesheet entry (date, task, hours, approval status), so the exported file is a complete, traceable audit trail rather than just the aggregated totals.

Exporting: click PDF, Excel, or CSV at any time — the export includes the filters you applied, who generated it, and a timestamp. Schedule Report currently only records your requested cadence and recipients for later wiring — it does not yet email reports on its own; see the README's "Swap points" section for what's needed to make it real.

8. Notifications

The bell icon in the top bar shows your in-app notifications — submission reminders, approvals waiting on you, rejections (with the approver's comment), and final-approval confirmations. Click to mark as read, or "mark all read" to clear the badge. For the full list plus channel preferences (email, in-app, digest frequency, and which reminder types you get), click View all in that dropdown, or go to Notifications from the "View all"/mail-icon shortcut in the top bar — the preferences panel lives alongside your notification list there.

9. Who can do what

Capability	Super Admin	HR Admin	Project Admin	Individual User
Enter & submit own timesheet	Yes	Yes	Yes	Yes
Approve timesheets	Yes (fallback)	—	Yes (own projects)	—
Manage users (incl. bulk)	Yes	Yes	—	—
Manage clients/projects/tasks	Yes	view only	Yes (own)	view (assigned)
Add people to a project / its tasks	Yes	—	Yes (own projects only)	—
Maintain holiday calendars (create/edit/delete, manage holidays)	Yes	Yes	—	—
Assign a client's holiday calendar	Yes	Yes	view only	—
Enable/send client timesheets	Yes	—	Yes (own projects)	—
View reports	all, org-wide	all, org-wide	own projects	own data only
Export reports	Yes	Yes	Yes (own projects)	own data only
System/security configuration	Yes	—	—	—
View audit log	full	HR-scoped	project-scoped	—

10. Getting help

If something looks wrong — a project you should be assigned to is missing, a cap seems misconfigured, or an approval seems stuck — your first stop is your Project Admin (for project/assignment questions) or HR Admin (for account or compliance questions). For anything that looks like a system bug rather than a data/configuration issue, contact the engineering team — see README.md for how the application is built and where to look.
